Primer sets for synthesizing polynuclectides, particularly the 5602 full length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.

Claim 8; SEQ ID NO 17352; 2537pp + Sequence Listing; English.

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dr primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end

a

```
sequence and an oligonucleotide comprising a sequence complementary to a polymucleotide which comprises a 3' end sequence, where the oligonucleotide comprises at least is nucleotides and the combination of the 5'-end sequence, selected from those defined in the specification. The primer sets can be used in antisense therapy and in particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH13742 represent human cond sequences; and AAH13629 to AAB92446 to AAB95893 represent human amino acid sequences, and AAH13629 to AAH3362 represent oligonucleotides, all of which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                             ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120

The invention relates to identifying (MI) a candidate ps. pathway in modulating agent, by contacting an assay system comprising a purified HW polypeptide (human orthologue of genes that modify the p53 pathway in Drosophila) or nuclaic acid with a test agent under conditions, where but correct the presence of the test agent, the system provides a reference activity, and detecting a test agent, the system provides a reference activity, and detecting a test agent, the system provides a reference activity, and detecting a test agent, the system provides a reference. Also included are modulating (M2) a p53 pathway of a cell (comprising contacting a cell defective in p53 function with a candidate modulator that specifically binds to a HM polypeptide comprising while a mammalian cell (comprising contacting the cell with an agent that specifically binds an HM polypeptide or nucleic acid) and diagnosing (M4) a disease in a patient (comprising: (a) obtaining a biological sample contacting the sample with a probe for HM expression; (c) comparison indicates a likelihood disease). (M1) is useful for diagnosing breast, colon, kidney, lung and ovarian cancer, in a patient, where the cancer has greater than 25 % expression level. Conditionators identified by (M1) are useful in a variety of diagnostic and therapeutic applications, where disease or disorder prognosis is related to proliferation disorders (e) cancer). Another two new methods (M2 and M3) are useful for modulating the p53 pathway of a cell, thus restoring the p53 pathway of a cell, cyle p53 function of the cell, so that the cell undergoes normal conserving the p53 function or progression through the cell undergoes normal conserving the p53 pathway such as angiogenic, apsorbetic or cell proliferation disorders. The present sequence conserving the p53 pathway such as angiogenic, represents a human p53 pathway modifying protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             o,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120

New polynucleotides and polypeptides for predicting the activity of compounds that interact with protein tyrosine kinases and/or protein Shaw P; SEQ ID NO 240; 139pp; English FY, Lee kinase pathways. Fairchild 2003-636735/60. N-PSDB; ADD14646. Claim 10; ъ, Huang

The present invention describes a predictor set comprising a plurality of the present invention describes whose expression pattern is predictive of the response of cells to treatment with a compound that modulates protein tyrosine kinase activity or members of the protein tyrosine kinase pathway. Also described: (1) predicting whether a compound is capable of modulating the activity of cells, comprising obtaining a sample of determining whether the cells comprising obtaining as ample of cells, correlating the expression of the markers to the compound's ability to modulate the activity of the cells; (2) a plurality of cell lines for identifying polynucleotides and polypeptides whose expression levels

```
with a disease state, and (3) identifying polynucleotides and polypeptides that predict compound sensitivity or resistance of cells cells increaring the predict compound sensitivity or resistance of cells a sesociated with a disease state, comprising subjecting the plurality of cell lines to one or more compounds, analysing the expression pattern of a microarray of polynucleotides or polypeptides, and selecting pattern of polymerication of the microarray. The polynucleotides and croarray. The polynucleotides and propertides are useful in predicting the polynucleotides and polypeptides are useful in predicting the cartivity of compounds that interact with protein tyrosine kinases and/or protein tyrosine kinase pathways. These may be used in determining drug sensitivity in patients to allow the development of individualized cancer; based on patient response at an anclecular level. The present cancer; based on patient response at an anclecular level. The present cancer; based on patient response at an anclecular level. The present cancer is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  410

The invention relates to 2175 novel human ovarian antigens (ABP41654-ABP4328) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identicial and polypucleotides 95% identical to to the sequences of the invention. The invention additionally relates to recombinant vectors and henceful somprising human ovarian antigen. Or recombinant vectors and not cells comprising human ovarian antigen. Or recombinant vectors and present human ovarian antigens, and the use of ovarian antigen polymucleotides and polypeptides in diagnosing, considers. Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine disorders, infertions (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, ophoritis and vaginitis), immune disorders (e.g., congenital and acquired toxic shock syndrome), inflammatory conditions (e.g., mastitis, ophoritis and vaginitis), immune disorders (e.g., congenital and acquired conformation antigen expression or activity. The polymucleotides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polymucleotides may be used for gene therapy, chromosome amapping, in the death of individuals and in forensic analysis, and the confidence data for this patent did not form part of the printed sequence cata for this patent did not form part of the printed confidence in the printed of sequence data for this patent did not form part of the printed of sequence cata for this patent did not form part of the printed of the formulation. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequence (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.
                                                                                                                                                                                                                                                                                                                        245 ATGSYDGFARIWTKDGNLASTLGQHKGPIFALKWNKKGNFILSAGVDKTTIIWDAHTGEA

(I) is useful for screening a compound for effectiveness as an agonist or antagonist, for screening a compound for specifically binds (I) or modulates the activity of (I) and for preparing a polyclonal or monoclonal antibody by hybridoma technology. Nucleic acids (II) (AB07244-AB07200) encocing (II) and for screening a compound for effectiveness in altering expression of a target solumning a compound for effectiveness in altering expression of a target polynucleotide comprising. Oligonucleotides and antibodies are useful for screening a compound, in a diagnostic test for a condition or a disease associated with the expression of MDDT in a biological sample, for detecting (I), an a sample, and for purifying (I) from a sample. A composition comprising (I), an associated with aberrant expression of MDDT; where the disorders are associated with aberrant expression of MDDT; where the disorders are associated with aberrant expression of MDDT, where the disorders are associated with aberrant expression of MDDT, where the disorders are associated from a cell proliferative disorder and an acid for minimatory disorder such as AIDS, Addison's disease, alternois or condition and alterny, anaemia, atherosclerosis, gout, multiple sclerosis or theumatoid arthritis. (II) are useful for creating knockin humanised and expression of more thereof is a resorder in a sample or the disorder in a sample or the formation and disease, in some the formation or more the entire or an addition or more the entire or t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    germline gene therapy, to generate a transcript image of a tissue or cell type, for detecting differences in the chromosomal location due to translocation or inversion among normal, carrier or affected individuals and as hybridisation probes for mapping naturally occurring genomic

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primeras, ollgomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) are to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to a ssess biodiversity and to produce other types of data and products dependent on DNA and anno acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in the printed specification, but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -- AATNOOGSA

                                                                                                                        쉱
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymerides are useful in gene therapy, vaccines or e.g. stem cell growth factor activity, nematopoiesis regulating activity, issue growth factor activity, immunomodulatory activity and activity, issue growth factor activity, immunomodulatory activity activity, insue growth factor activity, immunomodulatory activity activity, increament of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                  480
                                                                                                                                                                                                    547
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, cytokine, cell proliferation, cell differentiation, gene therapy, vaccine, peptide therapy, stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGN primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed sequence therapy techniques to restore normal setuity of (II) actorized disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders or polypeptide and polymuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this pattent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to multiprotein complexes from eukaryotes. Proteins of the invention and DNA sequences encoding them are given in records ABR52568-ABR53903 and ACC60610-ACC61944 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the Buropean Patent Office. The complete document is available on CD-ROM

XX

C the invention and DNA sequences encoding them are given in records of the invention and DNA sequences encoding them are given in records of the invention and DNA sequences encoding them are given in records or the invention and DNA sequences encoding them are given in records or the invention and DNA sequences of the protein complexes are obtainable by using a protein as a bait and isolating the set of proteins or which is attached theretof from cells. Such protein complexes may comprise to the disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this patent is not represented in the printed specification, but is based on comment is available on CD-ROW

New human intracellular signaling molecules (INTSIG)), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant INTSIG expression e.g. cancer, diabetes, epilepsy, or infections.

Claim 1; Page 225-226; 367pp; English.

The invention relates to 45 human intracellular signalling molecules (INTSIG-), INTSIG-145, and the cDNAs encoding them (ADA13319-ADA13408). The invention also encompasses expression constructs, host cells and transgenic organisms comprising an INTSIG nucleic acid sequence the recombinant preparation of a INTSIG, an antibody against a INTSIG, methods of detection of INTSIG proteins or nucleic acids; a micro-array containing INTSIG nucleic acids, a micro-array containing INTSIG nucleic acids, a micro-array containing INTSIG acids, a certerior of acids; a micro-array compositions comprising a cettvity or expression; and pharmaceutical acids; acids; an INTSIG acids are useful in diagnosing, treating or preventing a variety of disorders, including cell proliferative disorders (e.g., almos allergies, anaemia, asthma, bronchitis, gout, multiple sclerosis, osteoarthritis, rheumatoid arthritis, or systemic lupus erythematous); neurological disorders (e.g., epilepsy, stroke, fungal, parasitic, protozoan or helminthic infections; neurological disorders disease, dementia, or Parkinson's disease, dementia, or Parkinson's disease, dementia, or Parkinson's disease, independental disorders (e.g., achondroplastic dwarfism, Cushing's disease, hypothyroidism or hydrocephalus); endocrine disorders (e.g., achondroplastic dwarfism, Cushing's disease, hypothyroidism or hydrocephalus); endocrine disorders (e.g., cystic fibrosis or hypotholesterolesmia). The present sequence represents an INTSIG protein of the invention.

involved in intracellular signalling. An example of such an interaction is between protein kinase C and receptors of activated protein kinase (RACK), esp. RACK-1 (RAR85850). Proteins AAR85851-82 were isolated based on homology with beta-transducin, whereas proteins AAR85882-92 were isolated based on homology with the WD-40 consensus sequence (AAR85893). The proteins were used to construct the poptides AAR84928-R85063 and AAR85786-R85842. The peptides can be used to identify target proteins contg. WD-40 modifs, as modulators of enzyme esp. isozyme, activity of proteins involved in protein interaction and to screen for drugs that will affect protein interaction involving WD-40 domains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ----FDGR----PIESLSLIDA

                                                                                                                                                                                                                                                                                                                                                                                                                                                            93
                                                                                                                                                                                                                   The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7737-ABL3072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        70
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 62
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 77
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB27072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form part of the from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 78 EVIEGAPIKNIKRIPGEW-------IPRPPEK-FSLIGHRASITRVIFHPIFA

(HELI-) HELIX RES INST.

Isogai T, Nishikawa T, Sugiyama T, Wakamatsu Ota T, Is Ishii S,

Primer sets for synthesizing polynucleotides, particularly the 5602 full length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length Saito K, Ya , Otsuki T; Hayashi K, S A, Nagai K, WPI; 2001-318749/34.

Yamamoto J;

Claim 8; SEQ ID NO 17352; 2537pp + Sequence Listing; English.

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end

12-DEC-2002

```
sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the the soligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length AAH13613 to AAH13613 to AAH13613 to AAH13613 to AAH13613 represent human amino acid sequences, and AAH13629 to AAH13612 represent oligonucleotides, all of which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                 present invention

The invention relates to identifying (MI) a candidate psi pathway in polypeptide (human orthologue of genes that modify the p53 pathway in Drosophila) or nucleic acid with a test agent under conditions, where but core the presence of the test agent bissed activity of the assay system. Drosophila) or nucleic acid with a test agent provides a reference activity, and detecting a test agent-biased activity of the assay system. Also included are modulating (M2) a p53 pathway of a cell (comprising contacting a cell defective in p53 function with a candidate modulator that specifically binds to a HM polypeptide comprising an HM amino acid sequence, where p53 function is restored), modulating (M3) a p53 pathway in amamalian cell defective in p53 function with a call with an agent that sopecifically binds an HM polypeptide or nucleic acid) and diagnosing (M3) a disease in a patient (Comprising: (a) obtaining a biological sample from the patient; (b) contacting the acontrol; and diagnosing whether the comparison indicates a likelihood disease). (M1) is useful comparison indicates a likelihood disease). (M1) is useful for diagnosing breat, colon, kidney, lung and ovarian cancer, in a patient, where the cancer has greater than 25 % expression level. Confidentified by (M1) are useful in a variety of diagnositic and therapeutic applications, where disease or disorder prognosis is related to defects in the p53 pathway, such as, angiogenesis, apoptotic or cell corrective apoptotic or cell corrective acid in the p53 pathway of a cell, thus restoring the p53 function of the cell, so that the cell undergoes normal p53 function or progression through the cell cycle (M2) are also useful for modulating the p53 pathway such as angiogenic, apoptotic or cell proliferation disorders in the p53 pathway such as angiogenic, apoptotic or cell proliferation disorders in the p53 pathway such as angiogenic, apoptotic or cell proliferation disorders in the p53 pathway such as angiogenic, apoptotic or cell proliferation disorders. The present se
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                120

The present invention describes a predictor set comprising a plurality of polynucleotides or polypeptides whose expression pattern is predictive of the response of cells to breatment with a compound that modulates protein tyrosine kinase activity or members of the protein tyrosine kinase activity or members of the protein tyrosine kinase continued as the protein tyrosine kinase continued a capable of pathway. Also described: (1) predicting whether a compound is capable of correlating the activity of cells, comprising obtaining a sample of cells, correlating the expression of the markers to the compound's ability to correlating the expression of the markers to the compound's ability to correlate the activity of the cells; (2) a plurality of cell lines for identifying polynucleotides and polypeptides whose expression levels correlate with compound sensitivity or resistance of cells associated with a disease state, and (3) identifying polynucleotides and (cells associated with a disease state, compounds, analysing the expression pattern of a microarray of polynucleotides or polypeptides, analysing the sensitivity or resistance of cells associated with a disease state, compounds, analysing the sensitivity or resistance of cells associated with a disease state by using the correspondent of cells and polypeptides that predict the sensitivity or resistance of cells associated with a disease state by using the
